Model-independent determination of the CKM angle γ in $B^{\pm} \to (K^+K^-\pi^+\pi^-)_D h^{\pm}$ decays

Martin Tat Guy Wilkinson Sneha Malde

University of Oxford

102nd LHCb week

9th December 2021

Outline

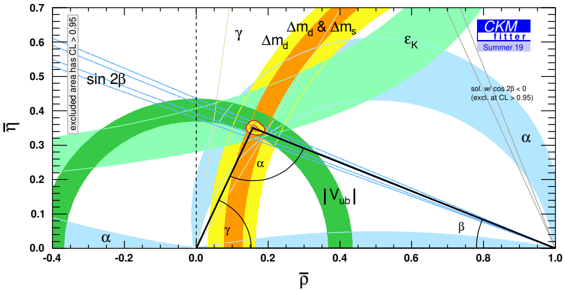
Introduction to the CKM angle γ

γ and the unitary triangle

- CP violation in SM is described by the Unitary Triangle

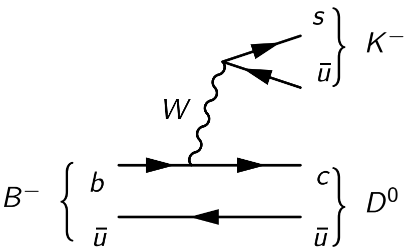
$$\gamma = \arg\left(- \frac{V_{ud} V_{ub}^*}{V_{cd} V_{cb}^*} \right)$$

- Only CKM angle accessible at tree level $\implies$
  - Negligible theoretical uncertainties
  - Ideal Standard Model benchmark
  - Compare with indirect measurements

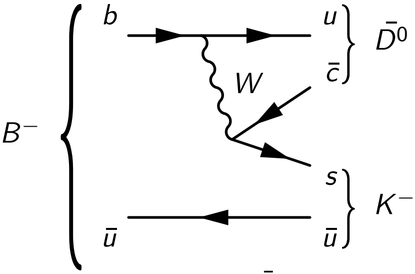


CKMfitter Group (J. Charles et al.), Eur. Phys. J. C41, 1-131 (2005)

Sensitivity through interference



(a) $B^- \to D^0 K^-$



(b) $B^- \to \bar{D}^0 K^-$

- Superposition of D^0 and $\bar{D}^0$
- $b \to u\bar{c}s$ and $b \to c\bar{u}s$ interference $\to$ Sensitivity to γ

$$\mathcal{A}(B^-) = \mathcal{A}(D^0) + r_B e^{i(\delta_B - \gamma)} \mathcal{A}(\bar{D}^0)$$
$$\mathcal{A}(B^+) = \mathcal{A}(\bar{D}^0) + r_B e^{i(\delta_B + \gamma)} \mathcal{A}(D^0)$$

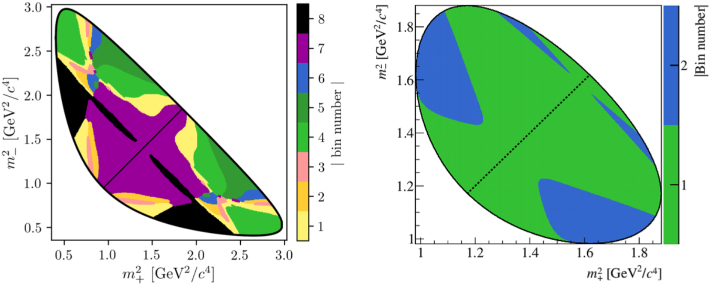
Measurement of γ from $B^{\pm} \to DK^{\pm}$, $D \to K^{+}K^{-}\pi^{+}\pi^{-}$

- First proposed by J. Rademacker and G. Wilkinson
  - Physics Letters B **647** (2007) 400
  - Amplitude model by FOCUS
  - Expected γ precision from amplitude fit with 1000 candidates: 14°
- CLEO amplitude analysis
  - Phys. Rev. D **85** (2012) 122002
  - Expected γ precision from amplitude fit with 2000 candidates: 11°
- State of the art amplitude analysis by LHCb:
  - JHEP **02** (2019) 126
  - Use to develop efficient binning scheme

Binned γ analysis of the $D \to K^+K^-\pi^+\pi^-$ mode

Binned measurement of γ

- Final measurement will be model-independent
  - Non-optimal binning reduces statistical sensitivity
  - But no bias is induced in final result
- Need strong phases of D decay $\rightarrow$ Will be measured at BESIII
- Analogous approach to $B^{\pm} \rightarrow Dh^{\pm}$, $D \rightarrow K_S^0 h^+ h^-$
  - JHEP **02** (2021) 0169
  - Single most precise measurement: $\gamma = (68.7^{+5.2}_{-5.1})^{\circ}$



The BPGGSZ method

- $B^\pm \to Dh^\pm$ amplitude:

$$\mathcal{A}(B^-) = \mathcal{A}(D^0) + r_B e^{i(\delta_B - \gamma)} \mathcal{A}(\bar{D}^0)$$
$$\mathcal{A}(B^+) = \mathcal{A}(\bar{D}^0) + r_B e^{i(\delta_B + \gamma)} \mathcal{A}(D^0)$$

- $\mathcal{A}(D^0)$ and $\mathcal{A}(\bar{D}^0)$ depend on D phase space
- Strong-phase difference of D^0 and $\bar{D}^0$ decays inaccessible at LHCb
- Model-independent measurement: Integrate over bins of phase space

Event yield in bin i

$$N_i^- = h_{B^-}\left(F_i + (x_-^2 + y_-^2)\bar{F}_i + 2\sqrt{F_i\bar{F}_i}(x_- c_i + y_- s_i)\right)$$
$$N_{-i}^+ = h_{B^+}\left(F_i + (x_+^2 + y_+^2)\bar{F}_i + 2\sqrt{F_i\bar{F}_i}(x_+ c_i + y_+ s_i)\right)$$

The BPGGSZ method

Event yield in bin i

$$N_i^- = h_{B^-}\left(F_i + (x_-^2 + y_-^2)\bar{F}_i + 2\sqrt{F_i\bar{F}_i}(x_- c_i + y_- s_i)\right)$$
$$N_{-i}^+ = h_{B^+}\left(F_i + (x_+^2 + y_+^2)\bar{F}_i + 2\sqrt{F_i\bar{F}_i}(x_+ c_i + y_+ s_i)\right)$$

- CP observables:
  - $x_\pm^{DK} = r_B^{DK}\cos\left(\delta_B^{DK} \pm \gamma\right), \quad y_\pm^{DK} = r_B^{DK}\sin\left(\delta_B^{DK} \pm \gamma\right)$
  - $x_\xi^{D\pi} = \mathrm{Re}(\xi^{D\pi}),\ y_\xi^{D\pi} = \mathrm{Im}(\xi^{D\pi}) \qquad \left(\xi^{D\pi} = \frac{r_B^{D\pi}}{r_B^{DK}} e^{i(\delta_B^{D\pi} - \delta_B^{DK})}\right)$
- Fractional bin yield:
  - $F_i = \frac{\int_i \mathrm{d}\Phi |\mathcal{A}(D^0)|^2}{\sum_j \int_j \mathrm{d}\Phi |\mathcal{A}(D^0)|^2}$
  - Floated in the fit, mostly constrained by $B^\pm \to D\pi^\pm$
- Amplitude averaged strong phases can be obtained from BESIII:

$$c_i = \frac{\int_i \mathrm{d}\Phi |\mathcal{A}(D^0)||\mathcal{A}(\bar{D}^0)|\cos(\delta_D)}{\sqrt{\int_i \mathrm{d}\Phi |\mathcal{A}(D^0)|^2 \int_i \mathrm{d}\Phi \left|\mathcal{A}(\bar{D}^0)\right|^2}} \qquad s_i = \frac{\int_i \mathrm{d}\Phi |\mathcal{A}(D^0)||\mathcal{A}(\bar{D}^0)|\sin(\delta_D)}{\sqrt{\int_i \mathrm{d}\Phi |\mathcal{A}(D^0)|^2 \int_i \mathrm{d}\Phi \left|\mathcal{A}(\bar{D}^0)\right|^2}}$$

Binning scheme

Binning scheme requirements

A binning scheme must satisfy the following:

- Minimal dilution of strong phases when integrating over bins
- Enhance interference between $B^\pm \to D^0 h^\pm$ and $B^\pm \to \bar{D}^0 h^\pm$

How to bin a 5-dimensional phase space?

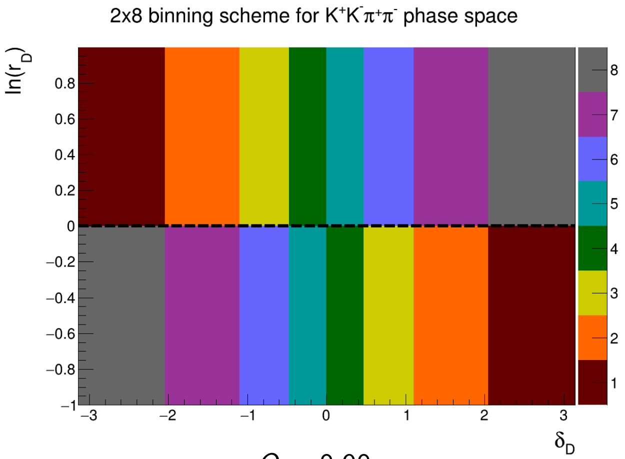
- Generate C++ code for LHCb amplitude model using AmpGen[1]
- For each $B^\pm$ candidate, calculate

$$\frac{\mathcal{A}(D^0)}{\mathcal{A}(\bar{D}^0)} = r_D e^{i\delta_D}$$

- Bin along δ_D and r_D, maximize Q-value to optimize

[1] AmpGen by Tim Evans

Binning scheme

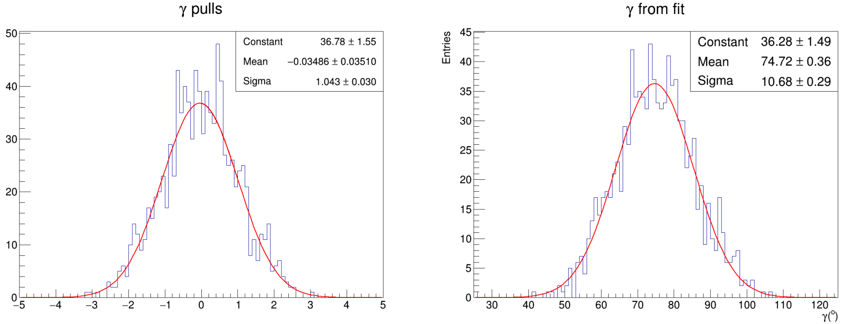


$Q = 0.90$

Bins $i < 0$ on top, $i > 0$ below

γ precision benchmark

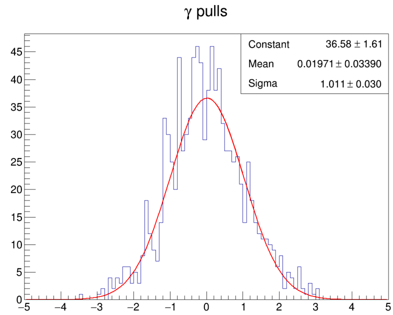
- Generate 2000 $B^\pm \to DK^\pm$ candidates using LHCb model in AmpGen
  - Input values: $\gamma = 75^\circ$, $\delta_B = 130^\circ$, $r_B = 0.1$
- Perform unbinned fit to the same amplitude model using AmpGen



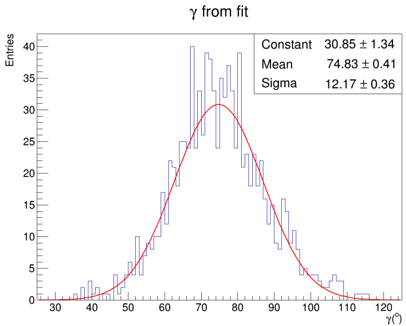
(a) Pull of γ **(b)** Fitted γ values

Precision of γ in unbinned fit: 11°

- Binned fit setup: Optimized 2×8 bins
- Fit same AmpGen samples, using c_i, s_i and F_i from LHCb model



(a) Pull of γ



(b) Fitted γ values

Precision of γ in binned fit: 12°
Consistent with unbinned fit and Q-value

Global mass fit

Signal parameterisation

- PDF shape parameterization identical to LHCb-ANA-2020-001
- Signal: Gaussian + Modified Cruijff
- Shape fixed from MC, yield and width floated
- Combinatorial background (exponential)
- Partially reconstructed background (dini shapes)

$$f_{\mathrm{MG}}(m|m_B,\sigma,\alpha_L,\alpha_R,\beta) \propto \begin{cases} \exp\left(\frac{-\Delta m^2(1+\beta\Delta m^2)}{2\sigma^2+\alpha_L\Delta m^2}\right), & \Delta m = m - m_B < 0 \\ \exp\left(\frac{-\Delta m^2(1+\beta\Delta m^2)}{2\sigma^2+\alpha_R\Delta m^2}\right), & \Delta m = m - m_B > 0 \end{cases}$$

Global mass fit

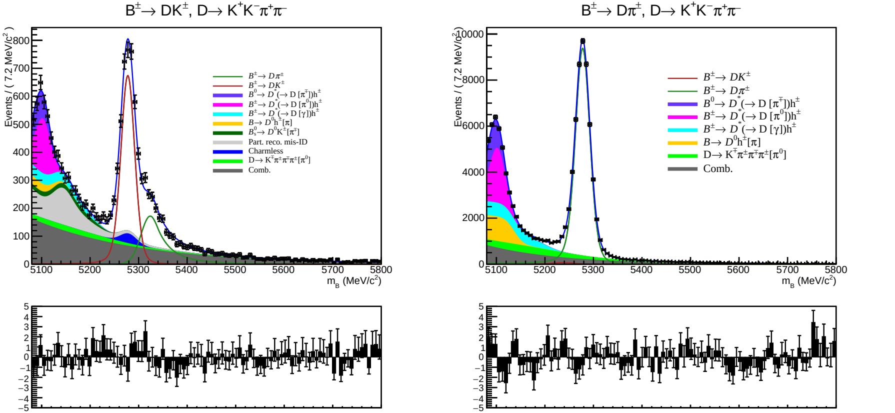


Figure 4: Fit of $B^{\pm} \to DK^{\pm}$ channel (left) and $B^{\pm} \to D\pi^{\pm}$ channel (right) using full Run 1 and 2 data

- $B^{\pm} \to DK^{\pm}$ yield: 3306 ± 75
- $B^{\pm} \to D\pi^{\pm}$ yield: $46\,695 \pm 256$

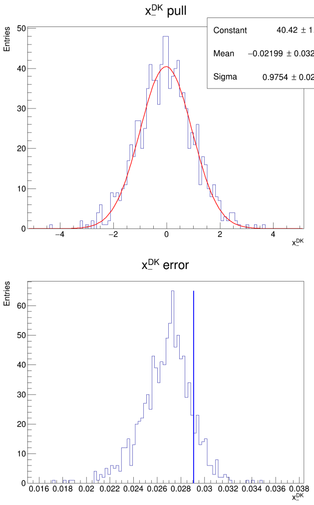
Binned CP fit

Binned CP fit

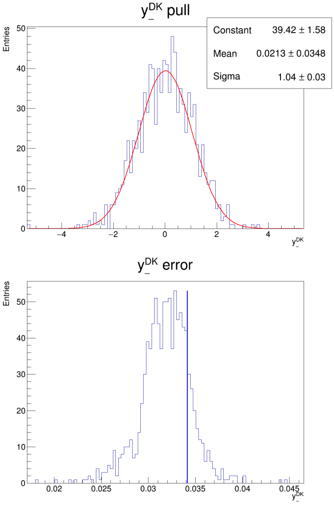
- Use 2×8 bins
- c_i and s_i not available from BESIII yet $\implies$
  - Calculate using MC integration of LHCb amplitude model for now
- Fit for CP observables
- PDF shape parameters fixed from global mass fit
- Yield of signal, low mass partially reconstructed background and combinatorial background floated
- Fractional yields F_i floated

$$\mathcal{R}_i = \begin{cases} F_i, & i = -8 \\ F_i / \sum_{j \geq i} F_j, & -8 < i \leq +8 \end{cases}$$

CP observables result: x_-^{DK} and y_-^{DK}



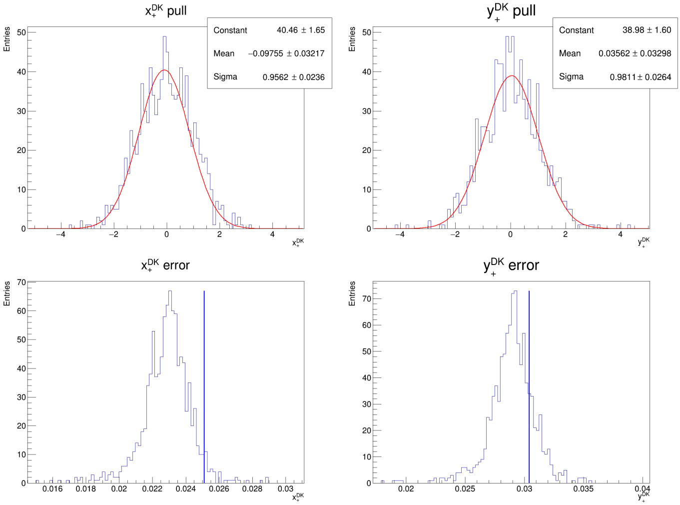
(a) $x_- = r_B \cos(\delta_B - \gamma)$



(b) $y_- = r_B \sin(\delta_B - \gamma)$

Pulls and uncertainties from toy studies, uncertainty from data fit in blue

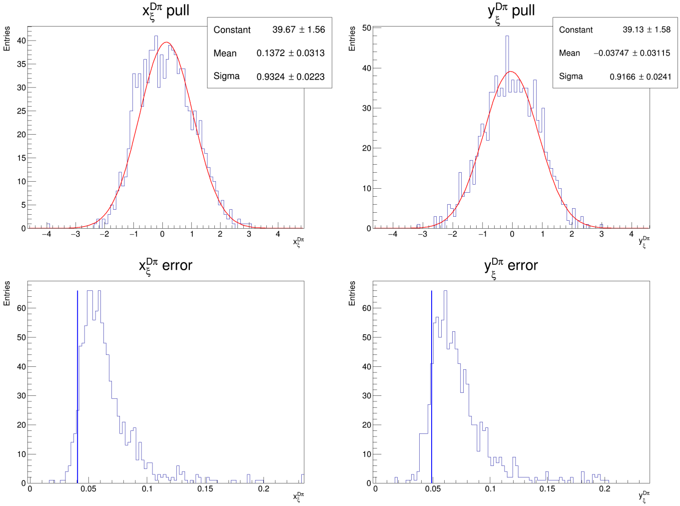
CP observables result: x_+^{DK} and y_+^{DK}



(a) $x_+ = r_B \cos(\delta_B + \gamma)$ **(b)** $y_+ = r_B \sin(\delta_B + \gamma)$

Pulls and uncertainties from toy studies, uncertainty from data fit in blue

CP observables result: $x_\xi^{D\pi}$ and $y_\xi^{D\pi}$



(a) $x_\xi = \mathrm{Re}(\xi)$ **(b)** $x_\xi = \mathrm{Im}(\xi)$

Pulls and uncertainties from toy studies, uncertainty from data fit in blue

Systematic uncertainties

c_i and s_i systematic uncertainty

- c_i and s_i uncertainty will come from BESIII analysis
  - Mostly statistical in origin
- Largest systematic uncertainty
- Use estimated uncertainties corresponding to $20\,\mathrm{fb}^{-1}$ at $\psi(3770)$
- Smear c_i and s_i and do many fits to data

Summary of all systematic uncertainties

Uncertainties of CP observables in units of 10^{-2}

Source	x_{-}^{DK}	y_{-}^{DK}	x_{+}^{DK}	y_{+}^{DK}	$x_{\xi}^{D\pi}$	$y_{\xi}^{D\pi}$

Summary and conclusion of $KK\pi\pi$ analysis

Summary of CP observables

- Measured CP observables:

$$
\begin{aligned}
x_-^{DK} =& (x.x \pm 2.9 \pm 0.4 \pm 0.7) \times 10^{-2},\\
y_-^{DK} =& (x.x \pm 3.4 \pm 0.2 \pm 1.6) \times 10^{-2},\\
x_+^{DK} =& (x.x \pm 2.5 \pm 0.3 \pm 0.3) \times 10^{-2},\\
y_+^{DK} =& (x.x \pm 3.0 \pm 0.3 \pm 1.3) \times 10^{-2},\\
x_\xi^{D\pi} =& (x.x \pm 4.0 \pm 0.9 \pm 1.7) \times 10^{-2},\\
y_\xi^{D\pi} =& (x.x \pm 4.9 \pm 0.7 \pm 1.0) \times 10^{-2},
\end{aligned}
$$

- Note: Currently using c_i and s_i from the LHCb model
- Publication strategy: Publish current results together with binned yields $\rightarrow$ Redo fit to obtain model-independent CP observables once c_i and s_i from BESIII are available
- Will update c_i and s_i with model-dependent uncertainties

Bonus measurement

- The mode $B^\pm \to Dh^\pm$, $D \to \pi^+\pi^-\pi^+\pi^-$ very similar
- Run this through same selection (including BDT)
- Quasi-GLW observables provide additional constraints on γ
- Measure observables for both $\pi^+\pi^-\pi^+\pi^-$ and $K^+K^-\pi^+\pi^-$

$$\begin{aligned} A_h =& \frac{\Gamma(B^- \to Dh^-) - \Gamma(B^+ \to Dh^+)}{\Gamma(B^- \to Dh^-) + \Gamma(B^+ \to Dh^+)}, \\ R_{\mathrm{CP}} =& \frac{R(4h)}{R(K3\pi)}, \\ R =& \frac{\Gamma(B \to DK)}{\Gamma(B \to D\pi)}. \end{aligned}$$

- $B^\pm \to Dh^\pm$, $D \to K\pi\pi\pi$ yields provided by Tim Evans

Global mass fit of $B^\pm \to Dh^\pm$, $D \to \pi^+\pi^-\pi^+\pi^-$

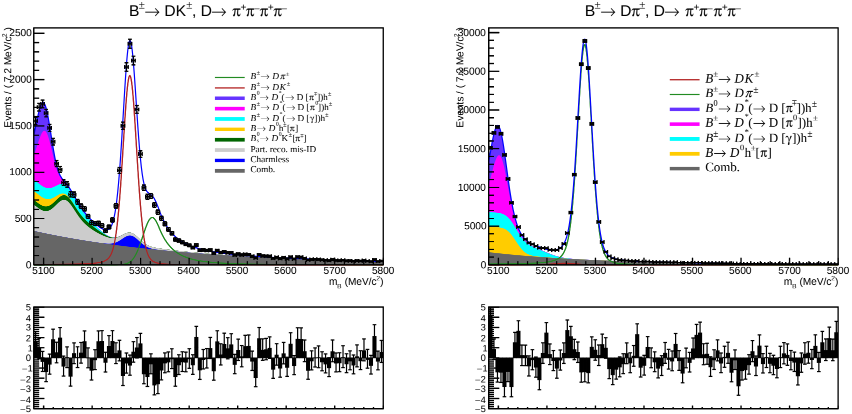

Figure 8: Fit of $B^\pm \to DK^\pm$ channel (left) and $B^\pm \to D\pi^\pm$ channel (right) using full Run 1 and 2 data

- Total yields are consistent with $KK\pi\pi$

Conclusion

- Binned γ analysis of $B^{\pm} \to (K^+K^-\pi^+\pi^-)_D h^{\pm}$ is mostly complete, with promising results
  - Expect total uncertainty around 12°-14°
- Add quasi-GLW observables of $K^+K^-\pi^+\pi^-$ and $\pi^+\pi^-\pi^+\pi^-$ to further constrain γ
- Will publish model-dependent measurement for now, update with model-independent results when c_i and s_i from BESIII are available
- Analysis note: LHCb-ANA-2021-051

Thank you!

Thank you!

Trigger requirements

Run 1 trigger requirements	(Bu_L0Global_TIS or Bu_L0HadronDecision_TOS) and (Bu_Hlt1TrackAllL0Decision_TOS) and (Bu_Hlt2Topo2BodyBBDTDecision_TOS or Bu_Hlt2Topo3BodyBBDTDecision_TOS or Bu_Hlt2Topo4BodyBBDTDecision_TOS or Bu_Hlt2IncPhiDecision_TOS)
Run 2 trigger requirements	(Bu_L0Global_TIS or Bu_L0HadronDecision_TOS) and (Bu_Hlt1TrackMVADecision_TOS or Bu_Hlt1TwoTrackMVADecision_TOS) and (Bu_Hlt2Topo2BodyDecision_TOS or Bu_Hlt2Topo3BodyDecision_TOS or Bu_Hlt2Topo4BodyDecision_TOS or Bu_Hlt2IncPhiDecision_TOS)

Initial cuts

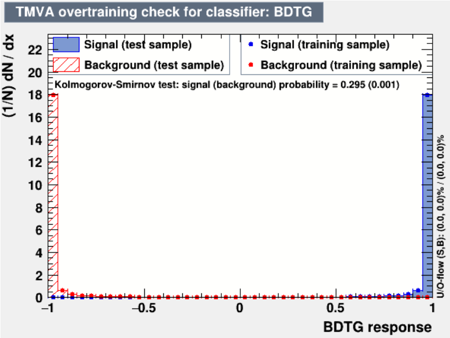
Rectangular cuts before BDT

Number	Variable description	Cut
1	DTF converged	True
2	Bachelor momentum	$< 100\text{GeV}$
3	Bachelor has RICH	True
4	D invariant mass	$[1839.84, 1889.84]\text{MeV}$
5	$B^{\pm}$ invariant mass	$[5080, 5800]\text{MeV}$
6	$K^{\pm}$ daughter PID	> -10
7	$\pi^{\pm}$ daughter PID	< 20

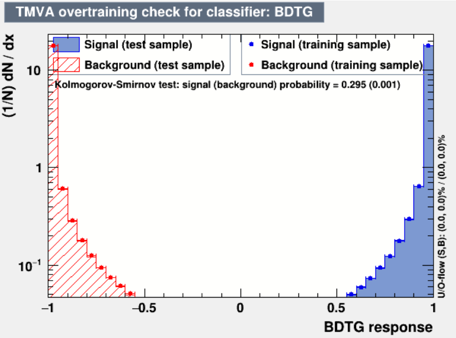
Boosted Decision Tree

- BDTG from TMVA Toolkit
- Signal sample: $B^{\pm} \to DK^{\pm}$ and $B^{\pm} \to D\pi^{\pm}$ MC samples
- Background sample: Data sample with $m_{B^{\pm}}^{\text{DTF}} \in [5800, 7000]$MeV
- Random, equal sized test and training samples

BDT training results



(a) BDT output



(b) BDT output on a logarithmic scale

Final cuts

Rectangular cuts after BDT

Number	Variable description	Cut
8	$K^\pm$ bachelor PID	> 4
9	$\pi^\pm$ bachelor PID	< 4
10	Bachelor is muon	False
11	z flight significance	> 2
12	$K^\pm$ PID	> 0
13	K_S^0 mass veto	$[477, 507]$MeV

BDT training variables

Name	Rank (%)	Description

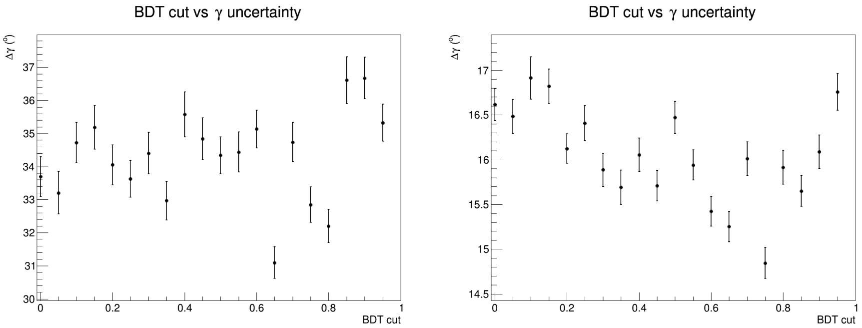
`log(Bu_PT)`	2.8	$B^\pm$ transverse momentum
`log(h[1,2]_P)`	2.8	$K^\pm$ momentum
`log(Bach_P)`	2.7	Bachelor momentum
`log(Bu_constD0PV_P)`	2.6	$B^\pm$ momentum from DTF
`log(h[1,2]_IPCHI2_OWNPV)`	2.5	$K^\pm$ impact parameter χ^2
`D0_MAXDOCA`	2.5	D distance of closest approach
`log(Bu_VTXCHI2DOF)`	2.0	$B^\pm$ vertex fit χ^2
`log(h[3,4]_P)`	1.9	$\pi^\pm$ momentum

BDT optimization study



(a) Run 1 **(b)** Run 2

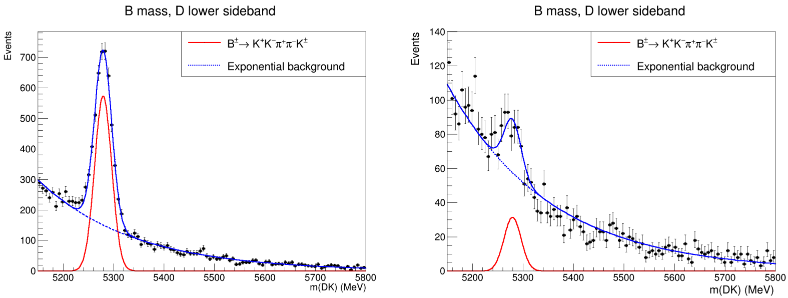
- Run 1: Pick BDT working point at 0.65
- Run 2: Pick BDT working point at 0.75

Partially reconstructed background

- $B^{\pm} \to D\pi^{\pm}$:
  1. $B^{\pm} \to (D^{*0} \to D^0[\pi^0])\pi^{\pm}$
  2. $B^0 \to (D^{*\mp} \to D^0[\pi^{\mp}])\pi^{\pm}$
  3. $B^{\pm(0)} \to D^0[\pi^{0(\mp)}]\pi^{\pm}$
  4. $B^{\pm} \to (D^{*0} \to D^0[\gamma])\pi^{\pm}$
- $B^{\pm} \to DK^{\pm}$:
  1. $B^{\pm} \to (D^{*0} \to D^0[\pi^0])K^{\pm}$
  2. $B^0 \to (D^{*\mp} \to D^0[\pi^{\mp}])K^{\pm}$
  3. $B^{\pm(0)} \to D^0[\pi^{0(\mp)}]K^{\pm}$
  4. $B^{\pm} \to (D^{*0} \to D^0[\gamma])K^{\pm}$
  5. $B_s^0 \to \bar{D}^0[\pi^+]K^-$
  6. Mis-ID from partially reconstructed $B^{\pm} \to D\pi^{\pm}$ channel

Charmless background

- $B \to KK\pi\pi K$ background in $B \to DK$ channel
- Flight significance cut at 2
- Fix remaining background with Gaussian shape of lower sideband



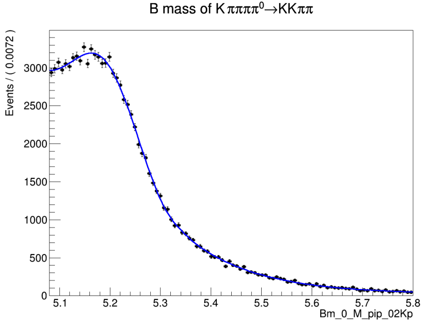
(a) No FS cut

(b) FS cut at 2

Figure 13: B invariant mass in lower D sideband

$D \to K\pi\pi\pi^0$ mis-ID background

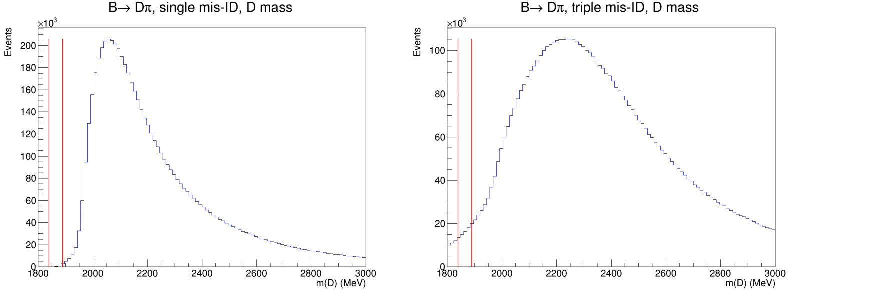
- $B^\pm \to Dh^\pm$, $D \to K\pi\pi\pi[\pi^0]$
- π^0 not reconstructed $\to$ Lower D mass
- Single mis-ID: $K\pi\pi\pi \to KK\pi\pi \to$ Higher D mass
- Generate RapidSim samples, reweight with PIDCalib2



Conclusion: Fix shape from RapidSim, allow yield to float

$D \to K\pi\pi\pi$ mis-ID background

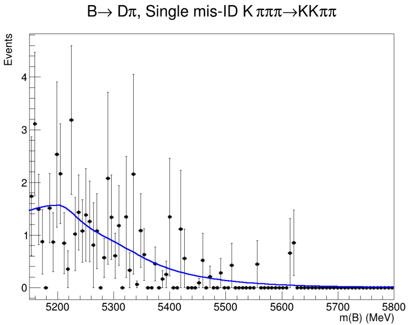
- $B^{\pm} \to Dh^{\pm}$, $D \to K\pi\pi\pi$
- Single mis-ID: $K\pi\pi\pi \to KK\pi\pi$
- Triple mis-ID: $\pi\pi K\pi \to KK\pi\pi$
- Use LHCb MC generated with AmpGen, reweight with PIDCalib2



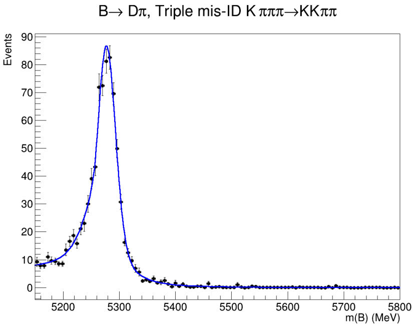
(a) Single mis-ID **(b)** Triple mis-ID

Figure 14: D invariant mass

$D \to K\pi\pi\pi$ mis-ID background



(a) Single mis-ID



(b) Triple mis-ID

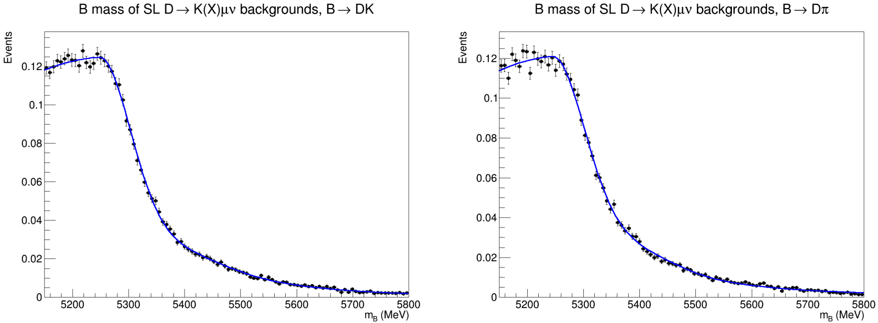
Figure 15: B invariant mass

Conclusion: Negligible impact, include in systematics

D semileptonic backgrounds

- $B^\pm \to Dh^\pm$, $D \to K(X)l\nu$, $K(X) \to K\pi\pi$
  - $K_1(1270)$
  - $K_1(1400)$
  - $K^*(1410)$
  - $K^*(1680)$
  - $K_2^*(1430)$
- Single mis-ID: $K\mu\pi\pi \to KK\pi\pi$
- Double mis-ID: $K\pi\pi\mu \to KK\pi\pi$
- Generate RapidSim samples, reweight with PIDCalib2

D semileptonic backgrounds



(a) $B \to DK$ **(b)** $B \to D\pi$

Conclusion: Negligible impact, include in systematics

Remaining systematic uncertainties

Different strategies for evaluating systematic uncertainties:

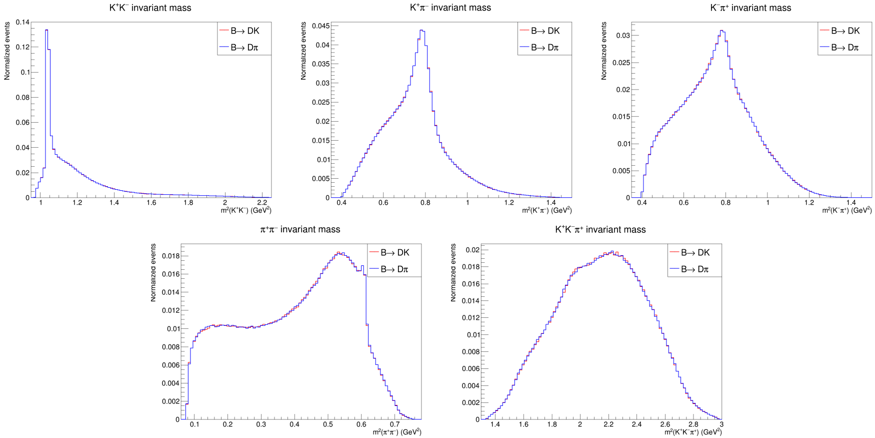
- Generate toy datasets with systematics, fit with default model and take the bias as a systematic:
  - Small backgrounds ($D \to K(X)l\nu_l$, $D \to K\pi\pi\pi$, $B \to Dl\nu_l$, Λ_b)
  - Bin dependent mass shape
  - Low mass physics effects
- Do multiple fits to data while smearing parameters:
  - c_i and s_i
  - Mass shape
  - Fixed yield fractions
  - PID efficiency
- Fit bias: Take bias toys as systematic uncertainty

Efficiency related systematics

Efficiency related systematics:

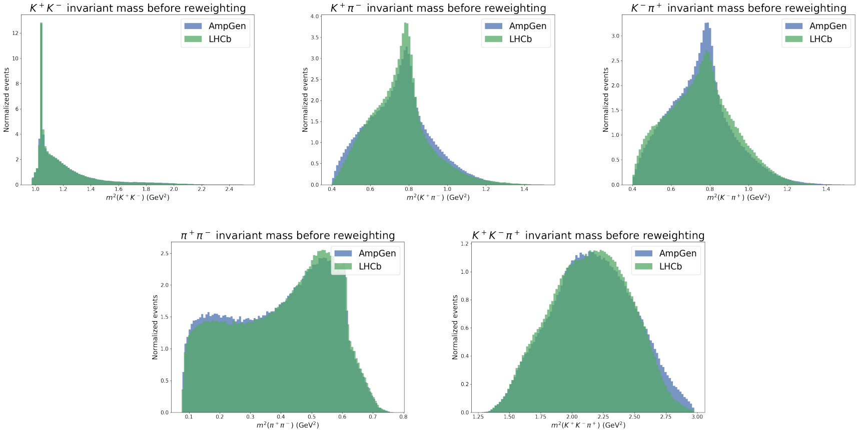
- Difference in $B^\pm \to DK^\pm$ and $B^\pm \to D\pi^\pm$ phase space acceptance
- Efficiency correction of c_i and s_i

Efficiency differences between $B^{\pm} \to DK^{\pm}$ and $B^{\pm} \to D\pi^{\pm}$



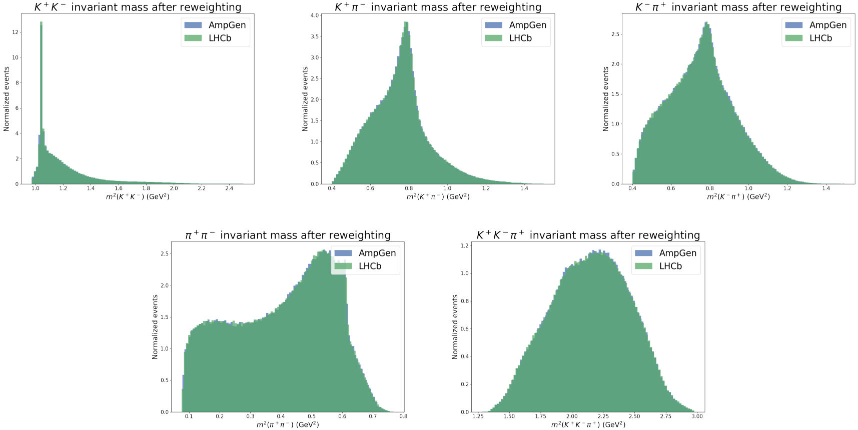
Conclusion: More or less identical phase space acceptance, no systematic uncertainty considered

Efficiency correction of c_i and s_i



Need to reweight events to account for efficiency differences between AmpGen samples and LHCb MC

Efficiency correction of c_i and s_i



After reweighing, use weights to recalculate c_i and s_i

Conclusion: Efficiency correction of c_i and s_i is an order of magnitude smaller than their uncertainties, no systematic uncertainty considered
